Matt,

Here's the GSENM List of Historic & Scientific Objects of Interest.

Thx to Dana for a finding a web version with **many** less corruptions/road blocks and Ken for helping to hand enter this more rapidly!

:)

All the topographic features of the Kaiparowits			
region have been developed in sedimentary			
rocks. The Kaiparowits Plateau is a slightly			
tilted sedimentary mass that extends as a			
narrow mesa from the High Plateaus to Glen			
Canyon 70 miles distant. Its culminating point,			
Canaan Peak is an outlier of the Table Cliff			
Plateau; the Paria Plateau is a huge block of			
sandstone, the Waterpocket monocline is a ridge of folded rock intricately dissected and			
flanked by hogbacks, and the broken "comb"			
in the vicinity of Paria is the edge of sandstone			
beds upturned in the East Kaibab fold. The			
Circle Cliffs are inward-facing walls of			
sandstone that rim an oval depression. These			
prominent features are but large-scale			
examples of the mesas, buttes, and ridges that		HTDIM Co. 11 Pt 1

It contains primitive mammals including one of the potentially oldest marsupial fossils identified.  Invertebrate and vertebrate specimens found Straight Cliffs, Tropic Shale, and Dakota Formations. 13 collection sites recorded (gastropods, cephalopods in upper Cretaceous Formations, vertebrate in Dakota and Tropic Shales). Likely to occur along entire length of the Straight Cliffs  The Kaiparowits is of interest in understanding the evolution of mammals and other terrestrial vertebrates. Very little is known of Cretaceous mammals prior to the latest part of that period. The mid-Cretaceous mammalian twilight zone is spanned by the fossiliferous, terrestrial rock units of the Kaiparowits region. They contain unique evidence bearing on the early diversification of important mammalian groups of the Late Cretaceous. The thickness, continuity, and broad temporal distribution of the Kaiparowits sequence provides the opportunity to document changes in terrestrial vertebrate assemblages over a wide span of Late Cretaceous time.  Extremely significant fossils including marine and brackish water mollusks, turtles, crocodillians, lizards, dinosaurs, fishes, and mammals have been recovered from the Dakota formation, Tropic Shale, Straight Cliffs Formation (Tibbet Canyon, Smoky	Geologic Studies of the	
Gray Cliffs/Pink Cliffs - This sequence of rocks may contain one of the best and most continuous records of Late Cretaceous terrestrial life in the world. Formation has yielded early mammals, lizards, dinosaurs, crocodillians, turtles, mollusks.  Fossils deemed by the Museum of Northern Arizona in a 1976 study to be of major importance. They are found in the Cretaceous Wahweap Formation outcrops and include abundant fragments of turtle shells and dinosaurs, as well as several crocodile teeth. There is an excellent chance that mammal fossils will be found.  The Straight Cliffs Formation is limited to the southern Utah area. It contains primitive mammals including one of the potentially oldest marsupial fossils identified.  Invertebrate and vertebrate specimens found Straight Cliffs, Tropic Shale, and Dakota Formations. 13 collection sites recorded (gastropods, cephalopods in upper Cretaceous Formations, vertebrate in Dakota and Tropic Shales). Sixty sites have been recorded and the potential for additional sites is exceptionally high. Sites discovered to date include lithic scatters, 13 rockshelters (some w/storage cysts and rock art), 1 pithouse village site		
and 1 structure (probably of Anasazi origin). Some of the rock art and rock shelter and 1 campsite are potentially eligible for	North Escalante	Utah BLM Statewide Final
nomination to the NRHP.	Canyons/The Gulch ISA	Wilderness EIS, 1990.
Friendship Cove Pictograph site nominated to NRHP. This site consists of a set of large Fremont style pictographs painted on the face of a large sandstone cliff.	Phipps-Death Hollow ISA, eastern part	Utah BLM Statewide Final Wilderness EIS, 1990.
Forty-four sites of diverse types have been recorded in the area. 14 rock art (petroglyph and pictographs sites (2 from Fremont culture)), 1 Pit-house village site, lithic scatters of Paiute and Anasazi, and 6 rockshelters have been discovered. Potential for more sites is good.	Phipps-Death Hollow ISA	Utah BLM Statewide Final Wilderness EIS, 1990.
Situated at the intersection of three major prehistoric cultures the Plateau has long been a magnet for archeological study. It has been recognized that the Kaiparowits Plateau might contain important clues that would aid in answering questions in the archeology of the Southwest.		Utah Wilderness Coalition. Wilderness at the Edge. p. 147 and Lister, Florence C., Kaiparowits Plateau and Glen Canyon prehistory, an interpretation based on ceramics, 1964.
Fiftymile Mountain Archeological District contains more than 400 sites including Anasazi habitations and granaries. Important scientific value. Some of the most significant cultural resources in the Four Corners area. Archaeological District (47,325 acre) has been nominated to NRHP. Majority of sites are masonry structures (of 1-10 rooms). Most are of Virgin Anasazi origin but include sites attributed to Fremont, Hopi, and Paiute. Navajo are also expected of occupying the area. 4,000 total sites may be located in WSA.	•	Utah BLM Statewide Final Wilderness EIS, 1990.
Sixty-five sites have been recorded. They include lithic and ceramic scatters, masonry structures (granaries and storage cysts), one rock shelter. Masonry and some lithic/ceramic associated with Virgin Anasazi/Virgin-Kayenta Anasazi. Two are Pueblo 11-111 time period. Some sites are associated with Paiute-age or Archaic-age peoples. At least 8 sites in this area are eligible for nomination to the NRHP.	WahweapWSA	Utah BLM Statewide Final Wilderness EIS, 1990.
High concentration of prehistoric sites. Although surveys are incomplete for the Warm Creek unit more that 600 sites have been found ranging from lithic scatters and campsites to rockshelters.	Kaiparowits Plateau/Warm Creek unit	BLM, Kaiparowits power project environmental impact statement, 1976.
Part of a larger area extensively used by the Kayenta Anasazi and later the Southern Paiute Indians. Site densities expected to be moderate to high.	Kaiparowits Plateau/Squaw Canyon unit	ERT, 1980, Kaiparowits coal development and transportation study, final report.
Prehistoric site densities are high on top of Nipple Bench. Sites represent Fremont, Virgin Anasazi and Kayenta Anasazi. The sites represent complex associations of

Riparian zones are corridors for many of the region's species, including neotripocal migrant birds. The corridors (including the Escalante, and Paria Rivers and Johnson Creek and their tributaries) bisect the region north to south allowing for exchange of individuals among different animal populations. The importance of movement corridors to the long term viability of animal populations is of great scientific and management interest. This area would afford many opportunities to enhance this ecological issue. ect	Description	Location	Source
	from the Mojave, Arizona deserts and		
	northern Utah are all found here, with a few		
	species from the Great Plains. The Colorado		
	Plateau is surrounded by high mountains,		
	isolating the flora and fauna. Unlike many		
	ecosystems, the plant density, diversity and		
	stature within the monument is determined		
	more by substrate than climate.		
	,		
	Consequently, isolation, plus the great		
	diversity of substrates (providing a wider		
	range of soil chemisty and physical		
	characteristics) found within close proximity		
	to each other has resulted in a high level of		
	plant endemism in this area. Eleven species		
	found in the monument are found nowhere		
	else in the world. Of plants that occur only in		
	-		
	Utah or on the Colorado Plateau, 125 pecies		Wainanassita D. D. J. Fre

	The Colorado Plateau was uplifted and		
	downcut without deformation. As a		
	consequence, large areas of unmixed		
	geologic parent materials are exposed, and		
	plants must adapt to large array of highly		
	distinct parent materials. These substrates are		
	sharply demarcated, and often occur within		
	a few meters of each other. This situation		
	offers the unique opportunity to examine the		
	role of soil physical and chemical		
	characteristics in determining plant and		
	animal community structure independent of		
	climatic variables, an important ecological		
	1		
	question. It also results in different plant		
	community structure and dynamics than is		
	generally observed in other ecosystems. This		
	area contains shales, siltstones, mudstones,		
	sandstones and limestone of differing depths,		
	and deposited in a variety of environments		
	(marine, freshwater and eolian). Each soil		
	depth and depositional environment has very

Description	Location	Source
These canyons provide a high concentration of isolated, unique plant and invertebrate communities: hanging garden, rock crevice, and canyon bottom communities. Many relictual plant species can be found in these communities. Pack rat middens are abundant, providing paleoclimate and paleo-vegetation information.	Escalante canyons	Axelrod, 1960; BLM Wilderness EIS; Van Devender and Spauling, 1979; Fowler et al., 1995; Nabhen and Wilson, 1996.
Dunal pockets contribute Great Plains species to the flora. These are unique, isolated plant communities.	Cockscomb to Kaiparowits	Hintze, 1988.
Unique, isolated communities are located throughout the monument. These include hanging gardens, tinajas, canyon bottom, dunal pocket, salt pocket and rock crevice communities. They provide great opportunities for examining evolution, gene flow, island biogeography and other ecological principles.	Entire monument	Case and Cody, 1988; Diamond, 1981; Dott, 1996; Harris, 1984; Ludwig and Whitford, 1981; Fowler et al., 1995; Nabhen and Wilson, 1996; Roberts, 1987; Reice, 1994; Axelrod, 1960.
Biological conservation theory and literature suggests that large contiguous conservation areas increase both extent and probability of population survival, increases protection of migratory pathways, and is the most effective means of conserving aquatic and riparian communities.	Entire monument	Soule, 1987; Davidson et al., 1996; Miller, 1961; Minckley and Deacon, 1968; Armbruster and Lande, 1993; Fahrig and Merriam, 1985; Beier, 1993; Belovsky, 1987; Brown, 1971; Davidson et al. 1996; Diamond 1981; Frankel and Soule, 1981; Harris and Gallagher, 1989; Heaney, 1984; IUCN, 1978; Kushlan, 1979; Lomolino and Channell, 1995; Meffe and Carroll, 1994; Newmark, 1995; Noss, 1993; Patterson, 1984; Pickett and Thompson, 1978; Primack, 1993; Saunders et al. 1991; Shaffer, 1981; Soule, 1987; Soule and Wilcox, 1980; Wegner and Merriam, 1979; Wilcove et al., 1986; Willis, 1974.
The connection with Glen Canyon provides a larger protected area. It also provides low desert vegetation as part of the vegetational gradients. Large areas are important for maintaining the evolutionary potential of plants and animals, allowing for the exchange of genetic material among the separate populations that constitute a population.		Hintze, 1988; Shulz, 1993; Albee et al., 1988; Axelrod, 1960; Welsh, 1978; Stevens, 1992; Dott, 1996; Armbruster and Lande, 1993; Fahrig and Merriam, 1985; Beier, 1993; Belovsky, 1987; Brown, 1971 Davidson et al. 1996; Diamon 1981; Frankel and Soule, 1989; Harris and Gallagher, 1989; Heaney, 1984; IUCN, 1978; Kushlan, 1979; Lomolino and Channell, 1995; Meffe and Carroll, 1994; Newmark, 1995; Noss, 1993; Patterson, 1984; Pickett and Thompson, 1978; Primack, 1993; Saunders et al 1991; Shaffer, 1981; Soule, 1987; Soule and Wilcox, 1980; Wegner and Merriam, 1979; Wilcove et al., 1986; Willis, 1974.

ct	Description	Location	Source
	Cryptobiotic soil crusts are critical for soil		
	stability, nutrient availability for vascular		
	plants and normal soil surface temperatures.		
	_		
	These crusts are extremely fragile and easily		
	disrupted by soil surface disturbances such		
	as trampling or off-road vehicles. Since the		
	soils in the monument are highly susceptible		
	to erosion, it is important that these		D 1 1004 1005 D 1
	biocrusts be protected so they stabilize these		Belnap, 1994, 1995; Belnap
	erodible soil surfaces. In addition, these		and Harper, 1995; Belnap et al.,
	ecosystems have few nitrogen-fixing plants.		1994; Jefferies, 1989; Harper
	Since these crusts provide nitrogen to these		and Marble, 1988; Johansen,
	soils, they are a critical part of these nitrogen-		1993; Mack and Thompson,
	limited ecosystems.	Entire monument	1978; Fleischner, 1994.
	Disturbance of most soil surfaces in the		
	monument area will result in soil surface		
	temperature changes as bio-crusted surfaces		
	are darker than the substrates underneath		
	them. The expected lowering of temperature		
	with disturbance would result in cooler soil		
	temperatures, and thus later spring plant		
	germination and lower nutrient uptake rates.		
	This may adversely effect desert plant		
	growth in early spring. Surface temperatures		
	also influence foraging and burrowing		
	patterns for many soil invertebrates, and		
	many effect community dynamics of these		Ludwig and Whitford 1981;
	species.	Entire monument	Belnap 1995.
		Little monument	Demap 1775.
	stable documented to date, as both large and		
	small scale disturbances are limited spatially		
	and temporally. Very little of this area was		
	glaciated in the Pleistocene. Most plant		
	communities evolved without fire or grazing		
	by large ungulate herds, as evidenced by		
	characteristics of the soils and the flora.		
	Catastrophic events are minimal, with the		
	exception of wash bottoms. Microsite		
	disturbances are minimal as well, as most		
	soils support very low populations of		
	invertebrates. 1880 photos repeated in 1990		
	show many sites virtually unchanged, with		
	the same tree, shrub and grass individuals		
	present, indicating very low species' turnover		Belnap, 1995, 1996; Belnap et
	rates in this region relative to other		al., 1994; Mack and
	ecosystems. In addition, dead tree branches		Thompson, 1982; Fleischner,

Unlike most deserts that are primarily depositional environments, the CP is an erosional one (Welsh 1979; Nat Hist). This contributes to high endemism, as substrate material is not mixed. In addition, it makes this region highly susceptible to soil loss when surfaces are disturbed. This soil loss has a negative impact on plant and aquatic communities, as well as dam sediment loads. loads.	Entire monument	1994.
	Entire monument	1777.
The effects of scaling up and down are not		
known for many ecological processes. The		
multitude of variably sized, discrete		
watersheds found in this area offer a unique		
opportunity to test the effects of scaling for hydrological and biological processes. In		
addition, the close spacing of these		
watersheds offers a chance to separate the		
effects of area per se from other		Allen and Hoekstra 1987; Reice
environmental factors on community		1994; Pickett and White 1985;
structure.	Entire monument	Rosenweig 1985.
Semi-arid and arid lands of the western		
United States are highly susceptible to		
desertification. The lack of natural		
disturbance in much of this area offers the		
opportunity to study the effects of different		
types and levels of land use and to better		
understand the steps leading to		
desertification.	Entire monument	Dregne, 1983.
This area contains few exotic plants. Having		
this resource gives the opportunity to better		
understand what factors inhibit or facilitate		
exotic plant invasions. Roads have been		
heavily implicated in facilitating exotic plant		
invasion, while intact Cryptobiotic soil crusts		
and less favorable soil chemistry may inhibit		
such an invasion. Invasion could		
fundamentally alter these communities, by		Monsen and Kitchen, 1994;
